

WHAT IS CHIPSAFER?

Chipsafer is a platform that can track and detect anomalies in livestock behaviour at any time and place with the aim of isolating the outbreak of such anomalies as soon as possible.

The animal wears an external smart device that transmits information about it to our company server, for processing and analysis.

The farmer can know where the animals are and receive warnings if the animal is outside of a specified area or if an anomaly is detected. We transform the data gathered with our sensors into actionable information. The farmer can access all the information through his personal account.

Chipsafer is also useful to combat cattle rustling.

MISSION

security of livestock herds, while reducing ranchers environmental impact and providing traceability across the bovine lifecycle.

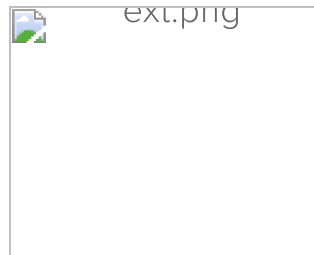

AWARDS

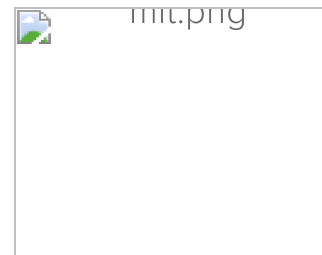

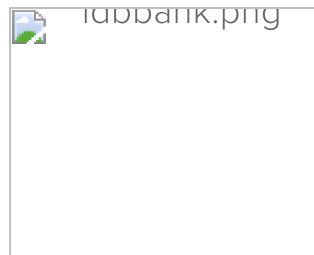

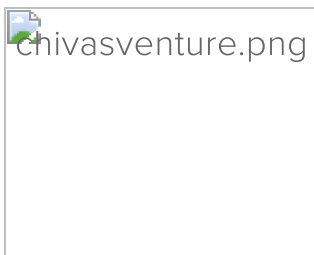

The Tech for
Global Good 2020-
21 Laureate.

Winner of the
**Extreme Tech
Challenge**, IOT
category, given by
CISCO.

**Selected by the
